

## ABSTRACT

An irrigated razor includes a resilient, hollow handle terminating in a transverse head piece provided with a slot wherein razor blades are mounted and exposed to the exiting water flow from the handle. The surfaces of the handle subjacent the head piece are folded into adjacent accordion folds which in response to pressure pulses in the handle articulate the blades over the skin of the user. Either a pulsating shower head branched from the water flow to the handle or a pulse mechanism directly in the flow provide the necessary pressure fluctuations.
